Panton-Valentine Leucocidin Toxin-Positive 
*Staphylococcus Aureus*-Mediated Neonatal Mastitis

**ABSTRACT**

Neonatal mastitis is an inflammatory condition of the breast frequently associated with *Staphylococcus aureus*. While Panton-Valentine leucocidin (PVL), a B-pore-forming cytotoxin, is commonly associated with enhanced virulence in community-acquired methicillin-resistant *S. aureus* isolates, this is the first report to our knowledge of neonatal mastitis caused by PVL-positive *S. aureus*.

A 20-day-old full-term female neonate presented with bilateral mastitis, complicated by bilateral abscess formation. PVL toxin-positive *S. aureus* was cultured from aspirates of both breasts.

All family members, none of whom presented with symptoms of infection, and, specifically, maternal vaginal samples proved negative for PVL-positive *S. aureus*. Successful resolution involved surgical drainage and clindamycin therapy.

While PVL toxin-positive *S. aureus* has previously been implicated in bovine and ovine mastitis, there may now be a need for vigilance with respect to human incidence. Due to PVL-mediated tissue necrosis, breast abscess formation and poor response to conventional antimicrobial therapy should, perhaps, be a cause for suspicion of PVL-bearing *S. aureus* and expediting of appropriate therapy to avoid potential for long-term consequences such as abnormal breast development.
